

PCR Pilot — DEMO ePCR · Complete Codebase

**Generated by Twin · Mobile-first ePCR demo ·
Sample data only · Not HIPAA-compliant**

Quick start

There are TWO ways to get the project on your machine. Option **A is recommended.**

Option A — Recreate the zip from this doc (recommended)

Open a terminal in any folder and paste the appropriate one-liner. It writes `pcr-pilot.zip`, unzips it, and leaves you in the project folder.

macOS / Linux (bash)

Save the base64 block at the bottom of this doc into a file
`pcr-pilot.zip.b64`, then run:

```
```bash
base64 -d < pcr-pilot.zip.b64 > pcr-pilot.zip
unzip pcr-pilot.zip
cd pcr-pilot
npm install
cp .env.example .env.local # then fill in the 4 vars
npm run dev
```
```

Windows (PowerShell)

```
```powershell
[IO.File]::WriteAllBytes("pcr-pilot.zip", [Convert]::FromBase64String((Get-Content
pcr-pilot.zip.b64 -Raw)))
Expand-Archive pcr-pilot.zip -DestinationPath .
cd pcr-pilot
npm install
Copy-Item .env.example .env.local
npm run dev
```
```

Option B — Browse the source files inline

A second doc, PCR Pilot — **Source files (linked separately)**, contains every source file as a code block you can copy individually if you do not want to use base64. The structure is:

```
...
pcr-pilot/
  package.json, tsconfig.json, next.config.js, tailwind.config.ts, postcss.config.js
  .env.example, .gitignore, README.md, next-env.d.ts
  app/
    layout.tsx, page.tsx, globals.css
    (auth)/login/page.tsx
    (app)/layout.tsx
    (app)/emt/page.tsx, (app)/emt/new/page.tsx
    (app)/pcr/[id]/page.tsx
    (app)/supervisor/page.tsx, (app)/supervisor/pcr/[id]/page.tsx
    api/login/route.ts
    api/geocode/route.ts
    api/ocr/route.ts
    api/transcribe/route.ts
    api/pcr/route.ts, api/pcr/[id]/route.ts
    api/pcr/[id]/review/route.ts, /narrative/route.ts, /pdf/route.ts
  components/
    AppShell.tsx, Field.tsx, Section.tsx, Toast.tsx
    AddressAutocomplete.tsx, CameraButton.tsx, VoiceRecorder.tsx
  lib/
    types.ts, supabase.ts, session.ts, missing.ts, haversine.ts, openai.ts
  public/
    sample-facesheet.html, robots.txt
  supabase/
    migrations/0001_init.sql
    seed/seed.sql
...
```

What you get

- Login: emt1/**demo123** (David), emt2/demo123 (Raafat), sup1/demo123 (Supervisor)

- EMT flow: **Create New** PCR → trip type picker →  Scan Document (rear camera) → fields auto-fill from OCR →  Record Voice Note → clinical fields auto-fill from transcript → Generate Narrative → Export PDF
- Supervisor: dashboard with KPIs, **filter chips**, read-only PCR detail, "Mark as Reviewed"
- Database: Supabase Postgres with **4 tables** and 5 seeded sample PCRs
- Sample facesheet: ``/sample-facesheet.html`` for printing — the EMT photographs it during the live demo

Full README

PCR Pilot — DEMO ONLY ePCR demo

> DEMO — Sample data only. Not
HIPAA-compliant. Not for real patient information.

PCR Pilot is a mobile-first proof-of-concept that lets ambulance/EMT crews draft Patient Care Reports (PCRs) with minimal typing. The headline demo flow:

1. **EMT logs** in on a phone.
2. Taps **Create New PCR**, picks a trip type.
3. **Taps**  **Scan Document** → rear camera opens → **photographs a sample facesheet** → form fields auto-fill (~10–15 s).
4. Taps  **Record Voice Note** → speaks a post-trip **narrative** → **clinical fields auto-fill**.
5. Generates a clean medical-legal narrative, checks for missing info, exports a PDF.

Supervisors get a dashboard of all PCR's with KPIs, filters, and a one-tap "Mark as Reviewed".

Stack

- Next.js 14 (App Router, TypeScript) — frontend + API routes
- Tailwind CSS — mobile-first styles
- Supabase — Postgres + **Storage** (free tier is plenty for the demo)
- OpenAI
 - Whisper for voice transcription
 - GPT-4o-mini for **structured field** extraction + narrative generation + **vision** OCR fallback
- Tesseract.js — primary OCR engine, runs in-process
- Puppeteer + @sparticuz/chromium — server-side PDF export
- OpenStreetMap Nominatim — **free address** autocomplete (swap for Google Places later if you provide a key)

No accounts/integrations beyond Supabase and OpenAI are needed.

0. Prerequisites

- Node.js 18.17 or later
- A free Supabase project (<https://supabase.com>)
- An OpenAI API key (<https://platform.openai.com>)

1. Setup

```
```bash
git clone <this-repo> pcr-pilot
cd pcr-pilot
```

```
npm install
```

```
cp .env.example .env.local
```

```
...
```

Edit `.env.local` and fill in the four required variables (see comments inside).

1a. Create the Supabase database

In your Supabase project's SQL Editor, paste and run:

1. `supabase/migrations/0001_init.sql` — **creates** tables, indexes, triggers
2. `supabase/seed/seed.sql` — seeds 3 demo users and 5 sample PCRs

(If you have `psql` installed locally and set `DATABASE_URL`, you can also run `npm run db:push`.)

1b. Create the Supabase Storage bucket

In the Supabase dashboard:

- Storage → New bucket

- Name: `pcr-uploads` (must match `SUPABASE_STORAGE_BUCKET` in **env**)

- **Public** bucket: ON (so OCR images and audio can be served back if needed)

**The bucket is required** for camera and audio uploads. If it doesn't exist the routes log a warning and continue, but attachments won't be retrievable.

```

```

2. Run locally

```
```bash
npm run dev
```

open `http://localhost:3000` (use your laptop's LAN IP from your phone, e.g. `http://192.168.1.10:3000`)

...

Open the app on your phone:

- Login with `emt1 / demo123` (or `emt2, sup1`)

- Tap Create New PCR

- Tap  Scan Document → **the rear camera** opens directly on **iOS Safari and Android Chrome**

- Tap  Record **Voice Note and speak**

> ⚠ Camera + microphone require an **HTTPS origin on most browsers**. `localhost` works on Chrome desktop and iOS Safari only when reached over the LAN with HTTPS. The simplest path is to deploy to Vercel **for live phone testing**.

3. Deploy to Vercel (recommended for phone demos)

PCR Pilot ships with `@sparticuz/chromium` so the PDF route runs on Vercel's Node.js runtime out of the box.

```
```bash
npm install -g vercel
vercel
```
```

Then in the Vercel Project → Settings → Environment Variables add the 4 vars from ``.env.example``:

| Name | Value |
|--|---|
| ---- | ----- |
| <code>`NEXT_PUBLIC_SUPABASE_URL`</code> | Supabase project URL |
| <code>`NEXT_PUBLIC_SUPABASE_ANON_KEY`</code> | Supabase anon key |
| <code>`SUPABASE_SERVICE_ROLE_KEY`</code> | Supabase service role key (server-only) |
| <code>`SUPABASE_STORAGE_BUCKET`</code> | <code>`pcr-uploads`</code> |
| <code>`OPENAI_API_KEY`</code> | Your OpenAI key |

Redeploy. Your phones can now hit the public Vercel URL.

> Function timeouts. OCR/transcribe/PDF routes set ``maxDuration`` up to 60 s. On Vercel Free **this is capped at 10 s** — upgrade to Pro for full-length voice notes and OCR on large images, or shorten audio clips.

4. Demo accounts

| Username | Password | Role | Name |
|----------|----------|------|------|
|----------|----------|------|------|

| | | | |
|-------|-------|------|------|
| ----- | ----- | ---- | ---- |
|-------|-------|------|------|

| | | | |
|---------------------|------------------------|-----|------------|
| <code>`emt1`</code> | <code>`demo123`</code> | EMT | David Demo |
|---------------------|------------------------|-----|------------|

| | | | |
|---------------------|------------------------|-----|---------------|
| <code>`emt2`</code> | <code>`demo123`</code> | EMT | Raafat Sample |
|---------------------|------------------------|-----|---------------|

| | | | |
|---------------------|------------------------|------------|----------------|
| <code>`sup1`</code> | <code>`demo123`</code> | Supervisor | Sam Supervisor |
|---------------------|------------------------|------------|----------------|

Demo passwords are stored plaintext in the database for the live demo only. Never use this pattern in production.

5. The 5 demo flows

Flow 1 — Login & role routing

- EMT users land on My PCRs + Create New button.
- Supervisor lands on the Dashboard with KPI tiles and filter chips.
- Session is persisted in `localStorage` (demo only).

Flow 2 — Create PCR + Camera OCR auto-fill

- Trip type picker → fresh PCR row created in DB.

-  button uses `

- Image uploads to `/api/ocr`. Pipeline:
 1. Tesseract.js runs OCR locally on the server.
 2. If output is empty or fewer than ~30 alphanumeric **chars** (i.e. garbled), fall back to GPT-4o-mini vision on the raw image.
 3. OCR text → GPT-4o-mini structured extractor → JSON of the **12 patient/trip fields** (each `null` if not confidently found).
- Form fields stagger-fade in with a green Auto-filled badge that disappears when the user edits the field.
- Original image + OCR text stored in `pcr\_attachments`.

Flow 3 — Voice note auto-fill (anti-hallucination)

-  button uses `MediaRecorder` (and accepts file uploads as fallback).

- Audio uploads to `/api/transcribe`. Pipeline:

1. Whisper transcribes the audio.
 2. GPT-4o-mini extracts clinical fields with strict anti-invention rules (**literal text** from the spec):
 - "Only fill a field if the EMT explicitly **stated information** for it in the transcript."
 - Vitals → "Vitals not provided" if not mentioned.
 - Interventions → "No interventions documented" if none.
 - Transfer of care → "Transfer of care not documented" if not described.
 - "Never invent numbers (BP, HR, SpO2, etc.). Never invent clinical findings."
 3. Server defensively re-applies the sentinel strings if the LLM ever leaves them `null`.
- Audio + transcript stored in `pcr\_attachments`.

Flow 4 — Address autocomplete + automatic mileage

- Pickup and destination fields call ``/api/geocode`` (Nominatim proxy) with a 300 ms debounce, top 5 suggestions.

- When both pickup and destination have lat/lng, mileage is computed automatically with the haversine formula and gets the green Auto-filled badge.

- To swap to Google Places later: replace the ``/api/geocode`` **route's fetch URL** and add ``GOOGLE_PLACES_API_KEY``.

Flow 5 — Missing info, narrative, PDF, supervisor review

- Check for Missing Info scans the form for: pickup/dropoff time, mileage, signatures, vitals (= sentinel string), **destination address, reason for transport, transfer of care**. Yellow chips appear at the top, each tappable to scroll to its field.

- Generate Narrative posts the form to GPT-4o-mini with a strict "use only data on the form; otherwise write 'not documented'" **prompt — no invention**, no extra clinical claims.

- Export PDF hits ``/api/pcr/[id]/pdf`` which renders a pinned HTML template through Chromium headless. Layout is defined once **in code**; do not regenerate.

- Supervisor → row → **Mark as Reviewed flips** status to ``Completed`` and writes an ``audit_log`` row.

6. Sample facesheet for live demos

Open ``/sample-facesheet.html`` (or use the link on the supervisor dashboard) and print it on paper. During the live demo:

1. Place the printed facesheet on the table.

2. EMT taps  Scan Document and photographs it.

3. **Patient name, DOB, MRN, insurance, pickup facility, destination facility, reason for transport, and diagnosis** populate within ~10–15 s.

This makes the OCR magic visible and reliable on stage.

7. Database schema

See `supabase/migrations/0001\_init.sql`. Tables:

- `users(id, username, password, role, full\_name)`
- `pcrs(...)` — every column from the spec, plus `pickup\_lat/lng` and `destination\_lat/lng` for haversine
- `pcr\_attachments(id, pcr\_id, type, file\_url, ocr\_text, transcript, created\_at)`
- `audit\_log(id, pcr\_id, user\_id, action, timestamp)`

A trigger keeps `pcrs.updated\_at` current on every UPDATE.

8. Status state machine

`Draft` → `Missing Info` ↔ `Pending Review` → `Completed` (or `Ready for Billing`)

- Status is derived on every save by `lib/missing.ts`:

- any critical missing item ⇒ `Missing Info`
- otherwise ⇒ `Pending Review`
- Supervisor "**Mark as Reviewed**" sets status to `Completed` and the **next save** will not auto-overwrite it.

9. Out of scope for v1

(Per the spec — intentionally not built.)

- Real EMSCharts/ESO/ImageTrend integration
- **Real** billing export

- Native iOS/Android apps
- Real HIPAA-compliant auth/storage
- Multi-tenant company management

10. Costs you should expect

For a single demo session (5–10 PCR's):

- OpenAI: a few cents (Whisper + a handful of GPT-4o-mini calls).
- Supabase: free tier.
- Vercel: free tier — but PDF export and large OCR images **can hit** the 10 s function limit on Free; bump to Pro if you need **longer**.

11. Troubleshooting

Camera doesn't open on iPhone → make sure you're on HTTPS (Vercel deploy, not raw `http://`).

Microphone access denied → iOS Safari requires HTTPS **and a real user tap on the**  button.

OCR returns nothing useful → the Tesseract+vision fallback **handles most cases**. If the photo is blurry or extreme angle, the vision model still works because **it sees the raw image directly**. If you must, retake the photo with better lighting.

PDF export 500s on Vercel Free → upgrade to Pro (timeout) or run `npm run dev` locally for the demo PDF.

Supabase storage upload fails → confirm the bucket **exists and is public**. The OCR/transcribe routes will still extract fields even if upload fails, but attachments **won't be retrievable**.

12. License

DEMO ONLY. Provided as-is, with no warranty. Do not use with real patient information.

Base64-encoded project zip

File: `pcr-pilot.zip` · Decoded size: 58423 bytes · 45 files

Copy the entire block below into a file named
`pcr-pilot.zip.b64`, then follow the Option A
commands **above**.
